JavaScript Assignment #5 – Conditional Statements (if / else)

Scenario:

You are now working as a **junior software developer** in a company.
Companies use **conditions** every day to decide things like:

- Can a user login?
- Should an order be approved?
- Is an employee eligible for a benefit?

In JavaScript, we use **if / else** statements to make such decisions.

Steps to Build the Project

Step 1: Create Project Structure

- Create a new folder named:
  `js-assignment-5`
- Inside the folder, create two files:
  - `index.html`
  - `script.js`
- Connect JavaScript with HTML:
- `<script src="script.js"></script>`

Industry-Based if / else Examples

Step 2: Employee Login System

Industry Scenario:
An employee can login to the company system **only if** the password is correct.

Tasks:

- Create a variable:
  - `isPasswordCorrect`
- Use `if / else` to:

    - Show “Login Successful”
    - Or “Incorrect Password”

Print the message in the console.

Step 3: Online Order Approval

Industry Scenario:
An online store approves an order if:

- Payment is successful

Tasks:

- Create variable:
    - `isPaymentDone`
- Use `if / else` to:
    - Approve the order
    - Or reject the order

Step 4: Student Result System

Industry Scenario:
A training institute checks student result:

- If marks ≥ 50 → Pass
- Else → Fail

Tasks:

- Create variable:
    - `marks`
- Use `if / else` to print result.

Step 5: Office Attendance Check

Industry Scenario:
An employee is marked **Present** if:

- They arrived on time

Otherwise:

- Mark as **Late / Absent**

Tasks:

- Create variable:
  - `isOnTime`
- Use `if / else`.

Step 6: Discount Eligibility

Industry Scenario:
An e-commerce website gives discount if:

- User is a premium member

Tasks:

- Create variable:
  - `isPremiumUser`
- Use `if / else` to show:
  - "Discount Applied"
  - Or "No Discount Available"

Step 7: Multiple Conditions (else if)

Industry Scenario:
Employee performance rating system:

- Score ≥ 90 → Excellent
- Score ≥ 70 → Good
- Score ≥ 50 → Average
- Else → Poor

Tasks:

- Create variable:
  - `performanceScore`
- Use `if / else if / else`.

Instructions for Students

1. Write all code in `script.js`.
2. Use comments to explain each condition.
3. Open browser → Inspect → Console to see output.
4. Change variable values and test different cases.
5. Take screenshots of console results.
6. Submit folder or ZIP file.

What You Will Learn

- How `if`, `else if`, and `else` work
- How companies use conditions in real systems
- How JavaScript makes decisions
- How to test multiple cases
